

Case Study: Contract Manufacturing Engineering Copier

A Fortune 500 office automation OEM was developing a new large format engineering copier to provide reduction/enlargement capabilities to end-users. Through early supplier involvement PEKO participated in the early stages of the product cycle effecting significant gains in design for assembly/manufacturing (DFA/DFM) with the customer. PEKO further provided full production including development of an extremely tight mirror classification/calibration process through use of **laser interferometry** inspection. Certified technicians were trained insuring quality levels, on-time deliveries, at all levels of production.
