

Case Study: Contract Manufacturing High Volume Photo Print Cassette

PEKO has an extensive background in imaging equipment manufacturing, including the intricate technologies for film handling (scratch-less transfer surfaces, etc.), paper path construction, light sealing (labyrinth, etc) and many other factors. With that, a global imaging OEM engaged the PEKO team to fully produce the photo cassettes pictured below. These aluminum cast cassettes allowed for wholesale photo prints to be produced in a non-stop fashion, as the cassettes provided raw photo stock to be both fed and removed through docking to a high volume laser print system. PEKO provided the manufacturing development engineering coupled with complete manufacturing through our in-house production machining, sheet metal, and assembly.
