

## Case Study: Product Development CNC Lathe Sub-spindle

A global leader in the machine tool industry approached PEKO to develop a product enhancement for a legacy lathe currently in production. With market pressures for cost reduction, the client required a “lights out” machining capability. PEKO developed a sub-spindle tooling package with an automated “cutoff” tool to provide the full automation option. The PEKO team provided all engineering and pilot build units on an aggressive timeline to meet product introduction at key trade show events.
