

Case Study: Contract Manufacturing Solar Crystal Growth Furnace

A global provider of solar cells required a step change in the manufacturing technology to efficiently produce their silicon “string ribbon” base. PEKO had mass produced (over 500 units) of their first generation technology allowing insight to the critical parameters required for mass deployment. Teaming with PEKO, the client provided the core science for the next generation, while PEKO provided complete engineering and manufacturing for the development through pilot build units to an extremely aggressive timeline.
